

Key Networking Devices

- Hub: In networking, Hub is a central device which serves as the center of a LAN. It is a simple connectivity device which links multiple devices and computers together.
- Switches: It is a hardware device that connects multiple hosts together in a LAN. Switch connects to the router and provide network to all devices. It forwards data based on hardware addresses.
- Router: It is a network device which is used to connect different networks. It filters and forward data based on IP addresses. They store network information, controlling and optimizing network traffic.
- Access Point: An accessing point connects wireless and Ethernet LAN, creating a wireless LAN.
- Firewall: Firewall is a network device which is used to permit or deny the network traffic according to the rules.
